# Anas Azkoul

Frontend Developer · Vue / TypeScript

Weert, Netherlands · [email] · [phone] · [LinkedIn] · github.com/AnasAzkoul

## PROFILE

Self-taught frontend developer with production experience on a live commercial platform. Certified Vue.js developer with a strong foundation in Vue 3, TypeScript, Nuxt, and Tailwind CSS, plus working backend knowledge (Node.js, REST APIs). Transitioned into software from a background in accounting and teaching, and now looking to move into a full-time development role in the Netherlands.

## SKILLS

**Languages:** JavaScript, TypeScript, HTML, CSS

**Frontend:** Vue 3 (Composition API), Nuxt 3, React, Next.js, Tailwind CSS, Radix UI, class-variance-authority

**Backend:** Node.js, REST API design, Hono, Drizzle ORM, PostgreSQL, NoSQL, Better Auth

**Tooling & Practices:** Git, ESLint, Prettier, AI-assisted development (Claude Code, Codex), component documentation

## EXPERIENCE

**Scala** — Sittard, Netherlands

***Frontend Developer, Services (trainee track)***

[Month Year] – Present

- Contributed production frontend code to Quintet, Scala's TypeScript/Nuxt QSR menu-board platform, across the canvas-based menu-board design app and the self-order terminals (SOT).
- Carried out the platform's migration from Nuxt 3 to Nuxt 4 within an AI-assisted development workflow (Claude Code) defined by the senior developer — driving the migration, reviewing generated changes, and resolving issues.
- Introduced a class-variance-authority pattern for component variants and sizes, replacing scattered if/switch logic with a dedicated typed module — making components reusable and scalable; the pattern was not previously in the codebase.
- Diagnosed and fixed a scheduling-page bug where an "unscheduled" warning icon only rendered for the active tab; traced it to parent-level data fetching and refactored the icon into a self-contained component with two-way parent-child communication so every tab resolved independently.
- Built a breadcrumb system from scratch for the app's deeply nested, multi-level dynamic routing — a composable, component, and definePageMeta configuration — including a route cache that resolved database-ID route segments into human-readable labels and pruned obsolete entries on navigation.
- Rebuilt a large portion of the shared atomic UI component library used by other developers, and wrote its documentation.
- Re-skinned the SOT UI into a themeable, white-label system for multiple customers' branding and adapted checkout/payment flows per customer.

***Technical Support Engineer***

[Month Year] – Present

- Diagnose technical issues across Scala's Content Manager and Player ecosystem — log analysis, CEF/Chromium compatibility, version-compatibility constraints, and network/DNS issues — for enterprise customers.
- Translate informal bug reports into structured Jira tickets and maintain internal support documentation.

## PROJECTS

**LearnFlow** — AI-powered educational platform *(in progress)*

- Building a full-stack learning platform with a Hono / Node.js API, Nuxt 3 frontend, Drizzle ORM, and PostgreSQL, deployed on Cloudflare (Workers / D1 / Pages).

- Integrating AI-driven lesson generation using a managed-agent (orchestrator–subagent) architecture.

**Client Portfolio Website** — Next.js, TypeScript, Tailwind *(2022)*
github.com/AnasAzkoul/martin-portfolio

- Designed and built a live, deployed portfolio-and-articles site end to end; first production project.
- Built an MDX-based articles system (frontmatter parsing, dynamic rendering) as a lightweight, CMS-free publishing workflow.
- Ported the client's legacy vanilla-JavaScript route-optimization visualizer (an interactive Travelling Salesman–style demo on a US map) to TypeScript — rewriting it as typed classes and wrapping the imperative Canvas rendering in a custom React hook so it integrated cleanly with Next.js's lifecycle, with responsive resizing and click interaction.

## CERTIFICATIONS

- **Certified Vue.js Developer (Level I)** — certificates.dev / Vue School, in partnership with Vue.js (2026). Proctored exam with live coding, developed under review by Evan You and the Vue core team.

## EDUCATION & LEARNING

- Self-taught software development (2021–present); Boot.dev backend track; ongoing study in system design and API architecture.
- Currently learning Python, with Django planned next as a backend framework; also learning Dutch (in-person course, Weert, 2026).
- [Degree] in Accounting — [Institution], [Year]

## LANGUAGES

English — fluent (former English teacher) · Dutch — beginner, in-person course from Aug 2026 · [Arabic / others?]
